

TeraBox Automation Tool

Setup & Usage Guide - @codex_here

STEP 1 - Install Python

Download and install Python from the link below. During install, TICK the box "Add Python to PATH".

```
https://python.org/downloads
```

STEP 2 - Open a Terminal

Press Windows+R, type `cmd` and press Enter. (PowerShell also works - commands for both are given below.)

STEP 3 - Create and enter a folder

```
mkdir C:\terabox  
cd C:\terabox
```

STEP 4 - Download the tool (2 files needed)

IMPORTANT: Download BOTH `main.py` AND `proxy_auth.py` into the same folder. The proxy login feature will not work without `proxy_auth.py`.

For CMD:

```
curl -L -o main.py  
https://raw.githubusercontent.com/Miten001/userbot/unchecked/tools/terabox-automation/main.py  
curl -L -o proxy_auth.py  
https://raw.githubusercontent.com/Miten001/userbot/unchecked/tools/terabox-automation/proxy_auth.py
```

For PowerShell:

```
Invoke-WebRequest -Uri  
"https://raw.githubusercontent.com/Miten001/userbot/unchecked/tools/terabox-automation/main.py"  
-OutFile "main.py"  
Invoke-WebRequest -Uri  
"https://raw.githubusercontent.com/Miten001/userbot/unchecked/tools/terabox-automation/proxy_auth.py"  
-OutFile "proxy_auth.py"
```

STEP 5 - Install dependencies

```
pip install selenium pyautogui
```

STEP 6 - Run the tool

```
python main.py
```

A dark-themed window will open. (Google Chrome must be installed on the PC.)

HOW TO USE THE GUI

- Link (URL): paste the URL you want to open.
- Pages: how many browser windows to open (1-1000).
- Use Proxy / IP Rotation: tick this to route traffic through proxies.
- Proxies box: paste your own proxies (one per line). Leave EMPTY to auto-fetch free proxies.
- Start Automation: begins opening windows and running the flow.
- Reset IP History: clears the used-IP history (including the day-wise history) so all IPs can be used again.

PROXY FORMATS (authenticated proxies now supported)

Paste in EITHER of these formats, one per line:

```
203.0.113.10:8080:username:password
username:password@203.0.113.10:8080
```

Plain proxies without a login also work:

```
203.0.113.10:8080
```

WHAT'S NEW / KEY FEATURES

- Authenticated proxies (user:pass) now work correctly (CDP-based proxy login).
- Fresh, unique fingerprint per window - user-agent, screen, WebGL, timezone, canvas noise.
- No IP reuse across different days: an IP used on a previous day is skipped automatically.
- This applies to BOTH your custom proxies and auto-fetched proxies.
- Country-filtered proxies, per-IP usage limit, and auto replacement on failure.

NEXT TIME (already installed)

```
cd C:\terabox
python main.py
```

TROUBLESHOOTING

- "python is not recognized": reinstall Python and TICK 'Add Python to PATH'.
- "tkinter not found": reinstall Python (default installer includes tkinter).
- Pages fail to load with a proxy: your proxy may be dead/blocked - try a paid residential proxy.
- Proxy login not working: make sure proxy_auth.py is in the SAME folder as main.py.
